The machine wings are telescopic and have a locking position for transport. For field work the wing then slides out 0.5m to work as a 4m machine. The front cutting disc also slides in allowing the toolbar to fit neatly behind the tractor for transport.

3m - 4m Low Disturbance Toolbar

The legs are hydraulically lowered and raised without moving the main frame. This can be done on the move providing versatility of the loosening element of the machine in certain cultivation processes. The hydraulic front cutting discs allow complete versatility when using the machine in varying ground surface conditions, especially when experiencing surface trash. This is all achieved through one hydraulic service on the tractor.

The toolbar can be fitted with a range of different styles of rear hitch attachments. The most popular we offer are Clevis or Link arms. We also offer all hydraulic services, free flow return and a 7-pin plug for trailed implements to the rear of the toolbar. ISOBUS and other electrical connections can be fitted if required.

The machine is built with low disturbance legs and points which provide a full width lift with minimal surface disturbance. The front cutting disc enhances the loosening element of the leg and eliminates the surface tension, thus reducing any opportunity of soil boiling in front of the leg along with easing the flow of trash through the machine.
